## 2. LITERATURE SURVEY

### Existing Problem:

- **Charging Infrastructure Availability:** In many areas, the availability of charging stations is limited, especially in rural or less densely populated regions. This can cause range anxiety for EV owners who might worry about running out of battery without access to a charging station.
  - **Charging Speed and Compatibility:** Different EVs have different charging standards and capabilities. Charging stations might not support all types of connectors and charging speeds, making it difficult for some EV owners to find suitable stations for their vehicles.
  - **Charging Speed vs. Dwell Time:** Fast charging stations are becoming more common, but they often require a shorter dwell time. This can be inconvenient for drivers who need to wait for their vehicle to charge, especially if the charging station is located in an area without amenities.
1. **Cost of Installation and Upkeep:** Installing charging stations can be expensive, and maintaining them can also incur significant costs. This can deter private businesses and governments from expanding the charging infrastructure.
  2. **Grid Capacity and Demand Management:** Rapid adoption of EVs could strain the electrical grid, especially during peak charging times. Proper management and upgrades of the grid are necessary to avoid overloads and ensure stable power supply.
  3. **Location and Accessibility:** Some charging stations might be poorly located, leading to accessibility issues for users. Convenient and visible locations, such as along major highways or near popular destinations, are essential for an effective charging network.
  4. **Payment and User Experience:** Payment systems at charging stations can be inconsistent, with different operators using various methods and subscription models. A streamlined and user-friendly payment process is essential for encouraging EV adoption.

5. **Maintenance and Downtime:** Technical issues with charging stations can lead to downtime, reducing the overall availability of charging infrastructure. Regular maintenance is crucial to ensure stations are operational.
6. **Permitting and Regulations:** Navigating the regulatory environment for installing charging stations can be challenging. Streamlined permitting processes and supportive regulations are necessary to encourage the expansion of charging infrastructure.
7. **Environmental Impact:** The electricity used to charge EVs is often generated from non-renewable sources. For the environmental benefits of EVs to be fully realized, efforts to transition the energy grid to cleaner sources are necessary.
